

Problem Statement – Interview Trainer Agent

The Challenge

Job seekers, especially students and freshers, often struggle to prepare effectively for job interviews, role-specific questions, and behavioral rounds. Information about industry expectations, HR guidelines, and interview patterns is scattered across multiple sources. Without personalized, real-time coaching, many candidates enter interviews underprepared and lacking confidence.

The Objective

Build an AI-powered Interview Trainer Agent that provides personalized, role-specific interview coaching for students and job seekers preparing for placements. The solution should:

- Generate role-specific technical and HR interview questions.
- Retrieve interview knowledge and industry expectations using a knowledge base (RAG).
- Conduct mock interviews and evaluate candidate responses.
- Provide personalized feedback, model answers, and improvement suggestions.
- Assess both technical and behavioral interview skills.
- Track interview readiness and overall progress.

Selected Solution

This project, InterviewMate – Agentic AI Interview Trainer, addresses the above problem using IBM watsonx.ai, IBM Granite Foundation Models, Python Streamlit, and a RAG-based knowledge base to deliver an intelligent mock interview experience.
